99th vs MRT (heat)
1st vs MRT (cold)
Primary
Primary analysis
Key sensitivity analyses (prespecified criterion)
Municipal temperature (case time series)
Lag 0–14
ns(time, 99 df), no strata
+ PM2.5 (lag 0–1, linear)
γ = 1 in the offset
Spontaneous preterm birth (i)
Residual autocorrelation
+ lagged deviance residuals (lags 1–7)
Exposure
Births-weighted metropolitan temperature
Maximum temperature
Minimum temperature
Apparent temperature
+ relative humidity (lag 0–3)
+ PM2.5, zero-missing series (23 concentrations)
Cross-basis
Lag 0–4
Lag 0–21
Quadratic B-spline, knots p10/p75/p90
Natural spline, knots p50/p90
Time trend and calendar
ns(time, 74 df), no strata
ns(time, 123 df), no strata
Strata × day of week
Excluding Dec 24 to Jan 1
Excluding 2020–2021
Warm season, Nov–Mar (own axis)
+ negative control exposure (t+1 to t+7)
+ local holidays
Risk set and offset
Fetal deaths in the risk set
Delivery risk weights by entry year
No offset
Possible-event window
Outcome definition
Extremely preterm, 22–27 wk (18 concentrations)
Very preterm, 28–31 wk
Moderate-to-late preterm, 32–36 wk
Spontaneous preterm birth (ii)
LMP-dated births, GA from the SINASC field (i)
LMP-dated births, GA from the LMP (ii)
2011 cohort, arm A (no offset)
2011 cohort, arm B (no offset)
Early term, 37–38 wk (comparison)
Early term, intersection window
Pooling and model
Fixed-effects meta-analysis
Multilevel meta-analysis
One-stage model
Penalized DLNM (vs concentration-specific reference)
